

# Pokemon Query

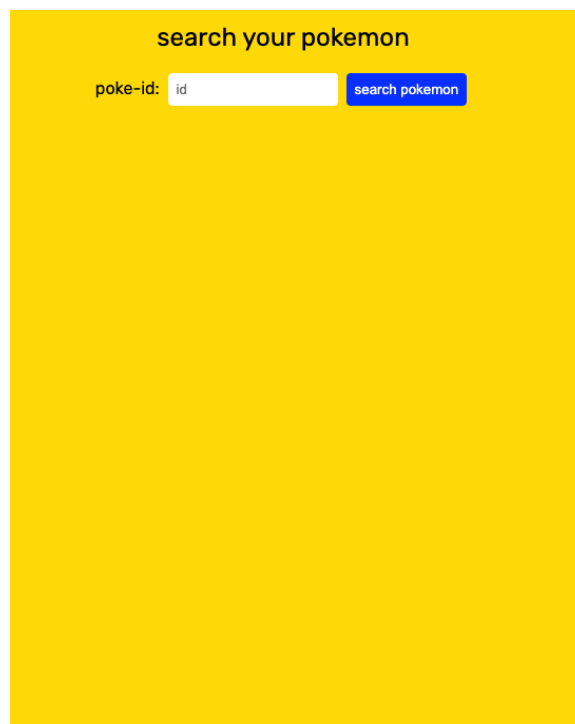

## Requirements

Create a pokemon query by pokemon id using **react** (ex. CRA, NextJS, webpack, vite, etc.)

- Please create an error handling logic for id that does not exist (example: 1000)
- **BONUS:** feel free to add features or change ui/ux
- **Please use the following endpoint:**
  - **pokemon-id:** <https://pokeapi.co/api/v2/pokemon/{id or name}/>
    - example: <https://pokeapi.co/api/v2/pokemon/1>
    - official reference: <https://pokeapi.co/>

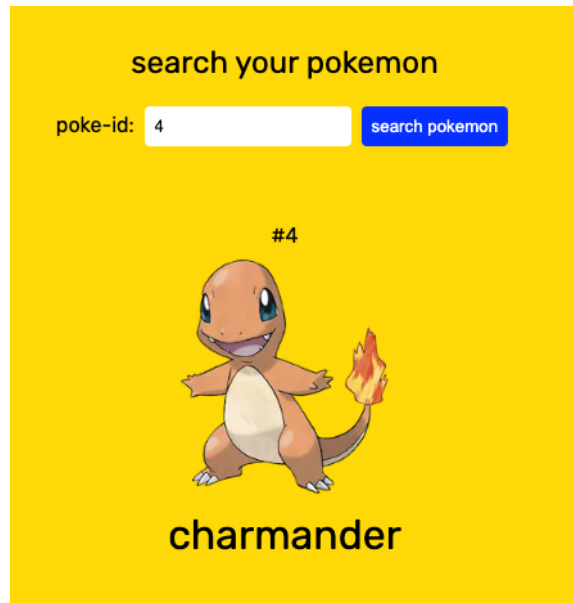

## Example

- Initial

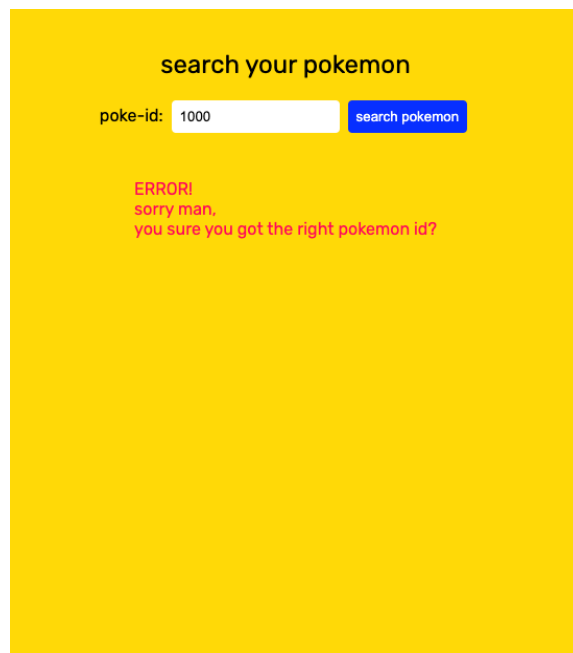

The screenshot shows a web application with a yellow background. At the top, the text "search your pokemon" is displayed. Below this, there is a label "poke-id:" followed by a text input field containing the value "id". To the right of the input field is a blue button with the text "search pokemon".

- Query

- Error (there is no pokemon with id of 1000)

- Please check attached gif file (pokemon-query.gif) for more

## Criteria

- Quality of the product
- Clean code
- Typescript
- UI/UX
- Documentation (README)

## Terms

- You are given **3 days** from the day you receive these instructions via email to complete the assignment.
- **FreeD Soft policy requires you to keep confidential information secure. Please be aware of your responsibilities to keep any FreeD Soft information priorities secure**

**When you finish the task, please compress the project in a zip file and email it to us.**

- Please include .git folder so that we can check your git commit history
- Do not include node\_modules folder
